# BRAIN CHIP TECHNOLOGY BY NEURALINK

Neuralink Corporation is a neurotechnology company that develops implantable brain machine interfaces (BMIs). Co-founded by ElonMusk, the company's headquarters is in the Pioneer Building in San Francisco sharing offices with OpenAI. [6] Neuralink was launched in 2016 and was first publicly reported in March 2017.

## What Is Neuralink ?

Neuralink is a gadget that will be surgically inserted into the brain using robotics by neurosurgeons. In this procedure, a chipset called the link is implanted in the skull. It has a number of insulated wires connected from the electrodes that are used in the process. This device can then be used to operate smartphones and computers without having to touch it. How does this' innovation (that is) pushing the boundaries of neural engineering 'work'

## How Does Neuralink Work ?

Before understanding how Neuralink works, it is best to comprehend the science behind the human brain. The brain consists of neurons that transmit signals to cells in the body including muscle, nerve, gland and other neuron cells. Every neuron is made up of three parts called the dendrite, the soma (celbody) and the axon. Each of these parts has its own function. The dendrite receives the signals.

The soma processes these signals. The axon then transmits the signals to the other cells. The neurons are connected to one another by the synapses which release neurotransmitters. These chemical substances are then sent to another neuron cell's dendrite causing the flow of current across the neurons .The electrodes that are part of the Neuralink will read electrical signals that are produced by several neurons in the brain. The signals are then outputted in the form of an action or movement.

According to the company's website, the device is implanted directly in the brain because placing it outside the head will not detect the signals produced by the brain accurately. Now that you know what Neuralink is and how it works, get to know what Neuralink does.

## What Does Neuralink Do ?

As mentioned above, Neuralink can be used to operate encephalopathy. It can also be used as a connection between the human brain and technology. This means that people with paralysis can easily operate their phones and computers directly with their brain. Its main purpose is to help people to communicate through text or voice messages. Of course, Neuralink is not limited To that, it can also be used to draw pictures, take photographs and do other activities.
